

When HTO Fails – UKR ?

Robert A. Teitge

Detroit Medical Center, Detroit, Michigan, U.S.A.

Dogma states that total knee arthroplasty is the treatment of choice after failure of high tibial osteotomy. HTO can fail for many reasons, most commonly due to progression of the unicompartment arthrosis as a result of insufficient axial correction. In this instance UKA can provide results the same as primary UKA results and equal to TKA results.
